

Data Insights and Visualizations

Using the wrangled data from the Udacity Data Wrangling project the following conclusions could be made:

Dogs in the life stage of pupper received a much higher rating by users on Twitter than dogs in the other life stages.

As can be seen from the data visualisation below Fig 1:

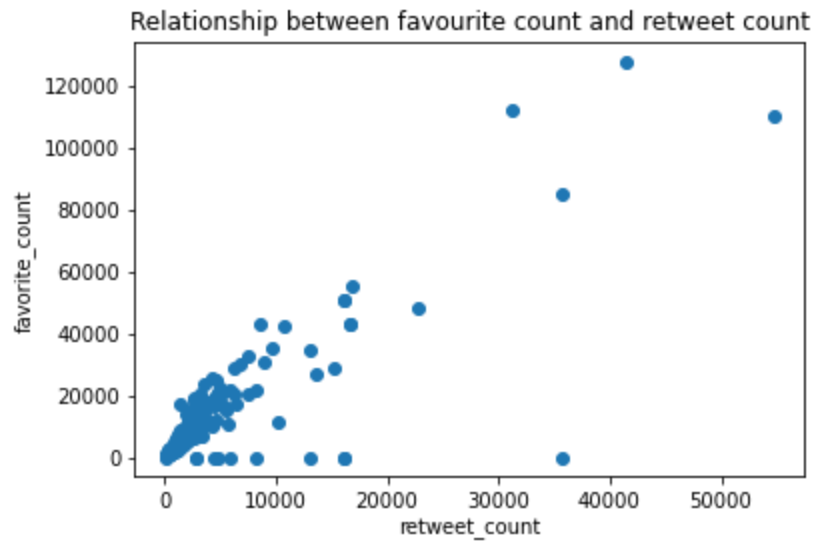

Fig 1

We then wanted to determine the times a tweet is retweeted and the favourite count if there is a relationship.

From the visualisation it seems like the higher the count of retweet the more like it is that a tweet will be favoured by users.

s

Finally I wanted to see if users from the different Twitter platforms voted in a particular way. From the data it seems that twitter for iphone seem to be the most popular platform for followers of the @weratedogs twitter account
